Description

The IBM11D2320L is an 8MB industry standard 72-pin 4-byte single in-line memory module (SIMM). The module is organized as a 2Mx32 high speed memory array, and is configured as two 1Mx32 banks -each independently selectable via unique $\overline{RAS}$ inputs. The assembly is intended for use in 16, 32 and 64 bit applications. It is manufactured with four 1Mx16 devices, each in a 400mil TSOP or SOJ package, and is compatible with the JEDEC 72-Pin SIMM standard.

The IBM11D1320L is a 4MB half-populated version, manufactured with two 1Mx16 devices in 400mil TSOP or SOJ package .

The IBM 72-Pin SIMMs provide a high performance, flexible 4-byte interface in a 4.25” long footprint.

1. I_{CC1}, I_{CC3}, I_{CC4} and I_{CC6} depend on cycle rate.
2. I_{CC1}, I_{CC4} depend on output loading. Specified values are obtained with the output open.
3. Address can be changed once or less while $\overline{RAS}$ = V_{IL}. In the case of I_{CC4}, it can be changed once or less when $\overline{CAS}$ = V_{IH}
4. Refresh current is specified for 1 bank active and 1 bank standby.

AC Characteristics (T_A = 0 to +70°C, V_{CC} = 5.0V ± 0.5V)

1. V_{IH} (min) and V_{IL} (max) are reference levels for measuring timing of input signals. Transition times are measured between V_{IH} and V_{IL}.
2. An initial pause of 100µs is required after power-up followed by 8 $\overline{RAS}$ only refresh cycles before proper device operation is achieved. In case of using internal refresh counter, a minimum of 8 $\overline{CAS}$ before $\overline{RAS}$ refresh cycles instead of 8 $\overline{RAS}$ only refresh cycles is required.
3. AC measurements assume t_T = 5ns.
4. When $\overline{CAS}$0 and $\overline{CAS}$1, or $\overline{CAS}$2 and $\overline{CAS}$3 go low at the same time, all 16 bits of data are read/written into the DRAM. $\overline{CAS}$0 and $\overline{CAS}$1, or $\overline{CAS}$2 and $\overline{CAS}$3 ($\overline{CAS}$'s to the same DRAM) cannot be staggered within the same read/write cycle.
