

# The fixltx2e package\*

Frank Mittelbach, David Carlisle

1999/12/01

## Abstract

This package provides fixes to  $\text{\LaTeX} 2_{\epsilon}$  which are desirable but cannot be integrated into the  $\text{\LaTeX} 2_{\epsilon}$  kernel directly as they would produce a version incompatible to earlier releases (either in formatting or functionality).

By providing these fixes in form of a package users can benefit from them without the danger that their documents will fail or produce unexpected results at other sites since the documents contain a clear indication (the `\usepackage` line preferably with a required date) that the fixes are being needed.

\*This file has version number v1.0b, last revised 1999/12/01.

# 1 Introduction

In the newsletter `ltnews07.tex` which accompanied the  $\text{\LaTeX}$  2 $\epsilon$  maintenance release of June 1997 we wrote:

Many of the problem reports we receive concerning the standard classes are not concerned with bugs but are suggesting, more or less politely, that the design decisions embodied in them are ‘not optimal’ and asking us to modify them.

There are several reasons why we have decided not to make such changes to these files.

- However misguided, the current behaviour is clearly what was intended when these classes were designed.
- It is not good practice to change such aspects of ‘standard classes’ because many people will be relying on them.

We have therefore decided not to even consider making such modifications, nor to spend time justifying that decision. This does not mean that we do not agree that there are many deficiencies in the design of these classes, but we have many tasks with higher priority than continually explaining why the standard classes for  $\text{\LaTeX}$  cannot be changed.

Back then we probably should have said that this decision also covers changes to the  $\text{\LaTeX}$  kernel if the change results in noticeable differences in the formatting of documents or otherwise produces severe incompatibilities between releases. The important point to stress here is that “people rely on the fact that a document formatted at one site produces identical output at a different site”. By fixing a certain problem in version  $\langle date \rangle$ , people making use of the fix will get incorrectly formatted documents if they send them to others who still run on a version prior to  $\langle date \rangle$ .

In theory one could get around this by adding a line like

```
\NeedsTeXFormat{latex2e}[\langle date \rangle]
```

on top of the document. However this fails for two reasons. Firstly most people will not be aware that they make use of a feature or fix that is only available in their version of  $\text{\LaTeX}$  and thus do not add such a line in their documents. Secondly even if there is such a line the receiving site might not be able to upgrade their  $\text{\LaTeX}$  in time to process the document properly (the latter is a sad fact of life).

By providing the `fixltx2e` package we hope to help people in this respect since if used their documents contain a clear indication that special features/fixes are needed and if the receiving site does not have the package available (or not available with the right version) it is far easier to download and install it from some archive than to upgrade  $\text{\LaTeX}$  in a rush.

We will try to maintain the package in a way that it can be used with all maintenance releases of  $\text{\LaTeX}$  2 $\epsilon$  so that, if urgently needed, people can simply add it to the current directory in case they cannot upgrade their  $\text{\LaTeX}$  for whatever reason.

The package is **NOT** provided so that people can stop upgrading their  $\text{\LaTeX}$  system. It will contain only fixes of a certain nature, others will still go into the kernel and extensions in form of packages and support files will still be added to the base system at regular intervals.

## 1.1 Usage

To use this package include the line

```
\usepackage{fixltx2e}[\langle date \rangle]
```

into the preamble of your document where  $\langle date \rangle$  is the date of the fixltx2e package that you are using.

This way your document will produce a warning if processed at a site that only has an older version of of this package.

## 2 Fixes added for 1999/12/01

This section describes the all fixes/features that have been added to the initial release of the package. If applicable the bug report info (see bugs.txt) is given.

### 2.1 2-col: 1-col fig can come before earlier 2-col fig (pr/2346)

```
>Number:      2346
>Category:    latex
>Synopsis:    2-col: 1-col fig can come before earlier 2-col fig
>Arrival-Date: Wed Dec 18 15:41:07 1996
>Originator:  w.l.kleb@larc.nasa.gov (bil kleb)
>Description:
as documented in lamport's book, p. 198, concerning figure
placement, "a figure will not be printed before an earlier
figure, and a table will not be printed before an earlier
table." however, there is a footnote stating, "However,
in two-column page style, a single-column figure can come before
an earlier double-column figure, and vice versa."
```

```
this twocolumn behavior is undesirable---at least by me and
most professional organizations i publish in.  ed snyzter developed
a hack fix for 2.09 several years ago which links the two
counters, but i have not run across a similar "fix" for 2e...
```

Originally fixed in package fix2col which was merged into this package. Documentation and code from this package have been merged into this file.

#### 2.1.1 Notes on the Implementation Strategy

The standard output routine maintains two lists of floats that have been ‘deferred’ for later consideration. One list for single column floats, and one for double column floats (which are always immediately put onto their deferred list). This mechanism means that L<sup>A</sup>T<sub>E</sub>X ‘knows’ which type of float is contained in each box by the list that it is processing, but having two lists means that there is no mechanism for preserving the order between the floats in each list.

The solution to this problem consists of two small changes to the output routine.

Firstly, abandon the ‘double column float list’ \@dbldeferlist and change every command where it is used so that instead the same \@deferlist is used as for single column floats. That one change ensures that double and single column floats stay in the same sequence, but as L<sup>A</sup>T<sub>E</sub>X no longer ‘knows’ whether a float is double or single column, it will happily insert a double float into a single column, overprinting the other column, or the margin.

The second change is to provide an alternative mechanism for recording the two column floats. L<sup>A</sup>T<sub>E</sub>X already has a compact mechanism for recording float information, an integer count register assigned to each float records information about the ‘type’ of float ‘figure’, ‘table’ and the position information ‘htp’ etc.

The type information is stored in the ‘high’ bits, one bit position (above ‘32’) allocated to each float type. The ‘low’ bits store information about the allowed positions, one bit each allocated for h t b p. In the L<sup>A</sup>T<sub>E</sub>X2.09 system, the bit corresponding to ‘16’

formed a ‘boundary’ between these two sets of information, and it was never actually used by the system. Ed Sznyter’s `fixfloats` package not unreasonably used this position to store the double column information, setting the bit for double column floats. Then at each point in the output routine at which a float is committed to a certain region, an additional check must be made to check that the float is (or is not) double column. If it spans the wrong number of columns it is deferred rather than being added.

Unfortunately the bit ‘16’ is not available in  $\text{\LaTeX 2}\epsilon$ . It is used to encode the extra float position possibility ‘!’ that was added in that system. It would be possible to use position ‘32’ and to move the flags for ‘table’, ‘figure’,... up one position, to start at 64, but this would mean that in principle one less float type would be supported, and more importantly is likely to break any other packages that assume anything about the output routine internals. So here I instead use another mechanism for flagging double column floats: By default all floats have depth 0pt. This package arranges that double column ones have depth 1sp. This information may then be used in the same manner as in the `fixfloats` package, to defer any floats that are not of the correct column spanning type.

## 2.2 Wrong headline for twocolumn (pr/2613)

```
>Number:          2613
>Category:        latex
>Synopsis:        wrong headline for twocolumn
>Arrival-Date:    Mon Sep 22 16:41:09 1997
>Originator:      daniel@cs.uni-bonn.de (Daniel Reischert)
>Description:
When setting the document in two columns
the headline shows the top mark of the second column,
but it should show the top mark of the first column.
```

Originally fixed in package `fix2col` which was merged into this package. Documentation and code from this package have been merged into this file.

### 2.2.1 Notes on the Implementation Strategy

The standard  $\text{\LaTeX}$  twocolumn system works internally by making each column a separate ‘page’ that is passed independently to  $\text{\TeX}$ ’s pagebreaker. (Unlike say the `multicol` package, where all columns are gathered together and then split into columns later, using `\vsplit`.) This means that the primitive  $\text{\TeX}$  marks that are normally used for header information, are globally reset after the first column. By default  $\text{\LaTeX}$  does nothing about this. A good solution is provided by Piet van Oostrum (building on earlier work of Joe Pallas) in his `fixmarks` package.

After the first column box has been collected the mark information for that box is saved, so that any `\firstmark` can be ‘artificially’ used to set the page-level marks after the second column has been collected. (The second column `\firstmark` is not normally required.) Unfortunately  $\text{\TeX}$  does not provide a direct way of knowing if any marks are in the page, `\firstmark` always has a value from previous pages, even if there is no mark in this page. The solution is to make a copy of the box and then `\vsplit` it so that any marks show up as `\splitfirstmark`.

The use of `\vsplit` does mean that the output routine will globally change the value of `\splitfirstmark` and `\splitbotmark`. The `fixmarks` package goes to some trouble to save and restore these values so that the output routine does *not* change the values. This part of `fixmarks` is not copied here as it is quite costly (having to be run on every page) and there is no reason why anyone writing code using `\vsplit` should allow the output routine to be triggered before the split marks have been accessed.

### 2.3 \@ discards spaces when moving (pr/3039)

>Number: 3039  
>Category: latex  
>Synopsis: \@ discards spaces when moving  
>Arrival-Date: Sat May 22 09:01:06 1999  
>Originator: asnd@triumf.ca (Donald Arseneau)  
>Description:  
The \@ command expands to \spacefactor\@m in auxiliary files,  
which then ignores following spaces when it is reprocessed.

### 2.4 \setlength produces error if used with registers like \dimen0 (pr/3066)

>Number: 3066  
>Category: latex  
>Synopsis: \setlength{\dimen0}{10pt}  
>Arrival-Date: Tue Jul 6 15:01:06 1999  
>Originator: oberdiek@ruf.uni-freiburg.de (Heiko Oberdiek)  
>Description:  
The current implementation of \setlength causes an error,  
because the length specification isn't terminated properly.  
More safe:  
\def\setlength#1#2{#1=#2\relax}

### 2.5 \addpenalty ruins flush-bottom (pr/3073)

>Number: 3073  
>Category: latex  
>Synopsis: \addpenalty ruins flush-bottom  
>Arrival-Date: Sat Jul 17 05:11:05 1999  
>Originator: asnd@triumf.ca (Donald Arseneau)  
>Description:  
Just to keep in mind for further development eh?  
A page break at an \addpenalty after \vspace does *\*not\**  
give a flush-bottom page. (The intent of \addpenalty is  
apparently just to preserve the flush bottom by putting  
the breakpoint 'above' the skip.)
